

scripts/video_confirm.sh

Last verified: 2026-06-16

Overview

§11.4.153 feature visual-confirmation helper. Captures a **window-scoped** frame (§11.4.154) of a running feature surface (default: the dashboard at `http://localhost:9090`), names it with the project prefix `ytdlp---<scope>---<ts>.png` (§11.4.155), sends it to a **vision-capable LLM ensemble** for a PASS/FAIL verdict, and records the **real** model response (no bluff) under `docs/qa/`.

Prerequisites

- A running feature surface (default dashboard :9090).
- Node/npm + Playwright (the repo ships `tests/e2e/`); chromium is auto-installed on first run.
- `curl`, `python3`, `base64`, `ffmpeg`.
- A **vision-capable model** reachable for the analysis step. Set `HELIXAGENT_URL` (default `http://localhost:7061`) and optionally `HELIXAGENT_API_KEY`.

Known prerequisite gap (verified 2026-06-16)

The analysis step needs a model that accepts **image input**. As verified on this host **neither available model can**: - The running **HelixAgent** build is **text-only** – its `/v1/chat/completions` rejects the OpenAI multimodal content array (400: cannot unmarshal array into ... content of type string) and its `/v1/vision/*` endpoints are stubbed. - The local `helix_ollama_video` Ollama has only `qwen2.5:3b` (text, no vision).

So the **capture** half works end-to-end, but the **ensemble-analysis** half is **operator-blocked** (§11.4.21) until a vision model is deployed – e.g. `podman exec helix_ollama_video ollama pull llava` (then point the harness at the Ollama vision endpoint), or configure a vision provider in HelixAgent. The harness does **not** deploy a model itself (that would modify operator infrastructure unprompted, §11.4.122) and does **not** fake a verdict when analysis is unavailable.

Usage

```
scripts/video_confirm.sh [scope] [url]
# default: scripts/video_confirm.sh dashboard http://localhost:9090
```

Outputs

- Recording: `/Volumes/T7/Downloads/Recordings/ytdlp---<scope>---<ts>.png`.
- `docs/qa/video-confirm-<date>/VERDICT.md` – capture result, HelixAgent health, the raw model response, and the parsed verdict (or the honest blocker).

Side-effects

- Writes one `ytdlp---<scope>---*.png` to the recordings path; **fresh-corpus rotation** (§11.4.154) deletes ONLY this project's own prior `ytdlp---<scope>---*` files "never foreign (`helixcode-*/helixtranslate-*`) or operator files (§11.4.122).
